Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Definition 1.1

Geometrically, a dataset is a sample of N points x_1, x_2, \dots, x_N in d -dimensional space \mathbb{R}^d . Algebraically, a dataset is an $N \times d$ matrix.

Practically speaking, the following are all representations of datasets:

matrix = CSV file = spreadsheet = SQL table = array = dataframe

Definition 1.2

Each point $x = (t_1, t_2, \dots, t_d)$ in the dataset is a sample or an example, and the components t_1, t_2, \dots, t_d of a sample point x are its features or attributes. As such, d -dimensional space \mathbb{R}^d is feature space.

Definition 1.3

Sometimes one of the features is separated out as the label. In this case, the dataset is a labelled dataset.

Iris dataset

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

The *Iris dataset* contains 150 examples of four features of Iris flowers, and there are three classes of Irises, *Setosa*, *Versicolor* and *Virginica*, with 50 samples from each class.

Samples (instances, observations)						Petal	
	Sepal length	Sepal width	Petal length	Petal width	Class label		
1	5.1	3.5	1.4	0.2	Setosa		
2	4.9	3.0	1.4	0.2	Setosa		
...							
50	6.4	3.5	4.5	1.2	Versicolor		
...							
150	5.9	3.0	5.0	1.8	Virginica		
Features (attributes, measurements, dimensions)					Class labels (targets)	Sepal	

MNIST dataset

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

The *MNIST dataset* consists of 60,000 images of hand-written digits. There are 10 classes of images, corresponding to each digit $0, 1, \dots, 9$. We seek to compress the images while preserving as much as possible of the images' characteristics.

Each image is a grayscale 28×28 pixel image. Since $28^2 = 784$, each image is a point in $d = 784$ dimensions. Here there are $N = 60000$ samples and $d = 784$ features.

Exercises

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Exercise 1.1

Use sklearn to download Iris dataset.

Exercise 1.2

- *From keras read the MNIST dataset.*
- *Let $(\text{train_X}, \text{train_y}), (\text{test_X}, \text{test_y}) = \text{mnist.load_data}()$*
- *Let $\text{pixels} = \text{train_X}[1]$.*
- *Do for loops over i and j in $\text{range}(28)$ and use scatter to plot points at location (i,j) with size given by $\text{pixels}[i,j]$, then show the following image.*

Introduction

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Suppose we have a population of things (people, tables, numbers, vectors, images, etc.) and we have a sample of size N from this population:

$$\mathbf{1} = [\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_N]$$

The total population is the *population* or the *sample space*.

Example 1.1

The sample space consists of all real numbers and we take $N = 5$ samples from

$$\mathbf{1} = [3.95, 3.20, 3.10, 5.55, 6.93]$$

Example 1.2

The sample space consists of all integers and we take $N = 5$ samples from

$$\mathbf{1} = [35, -32, -8, 45, -8]$$

Introduction

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Example 1.3

The sample space consists of all Python strings and we take $N = 5$ samples from

```
l = ['a2e?', '%T', '7y5', ' ', 'kkk>><</', '[]*+']
```

Example 1.4

The sample space consists of all HTML colors and we take $N = 5$ samples from

```
1 from random import choice
2 import matplotlib.pyplot as plt
3
4 def hexcolor():
5     return "#" + ''.join([choice('0123456789abcdef') for
6                           _ in range(6)])
7
8 for i in range(5): plt.scatter(i,0, c=hexcolor())
plt.show()
```

Mean

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Let \mathbf{l} be a list as above. The goal is to compute the sample *average* or *mean* of the list, which is

$$\text{mean} = \text{average} = \frac{x_1 + x_2 + \cdots + x_N}{N}.$$

In the Example (1.1), the average is

$$\frac{3.95 + 3.20 + 3.10 + 5.55 + 6.93}{5} = 4.546.$$

Example 1.5

```
1  import numpy as np
2
3  dataset = np.array([3.95, 3.20, 3.10, 5.55, 6.93])
4  print(np.mean(dataset))
5
6  output: 4.546
```

In the Example (1.2), the average is $\frac{32}{5}$. In the Example (1.3), while we can add strings, we can't divide them by 5, so the average is undefined. Similarly for colors: the average is undefined.

Vector space

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

A sample space or population V is called a *vector space* if, roughly speaking, one can compute means or averages in V . In this case, we call the members of the population "vectors".

Definition 1.4 (Vector space)

Let V be a set. V is a vector space (over \mathbb{R}) if for every $u, v, w \in V$ and $r, s \in \mathbb{R}$:

- 1** *vectors can be added (and the sum $v + w$ is back in V);*
- 2** *vector addition is commutative $v + w = w + v$*
- 3** *vector addition is associative $u + (v + w) = (u + v) + w$;*
- 4** *there is a zero vector 0 ($0 + v = v$);*
- 5** *vectors v have negatives (or opposites) $-v$ ($v + (-v) = 0$);*
- 6** *vectors can be multiplied by real numbers (and the product rv is back in V);*
- 7** *multiplication is distributive over addition $(r + s)v = rv + sv$ and $r(u + v) = ru + rv$;*
- 8** *$1v = v$ and $0v = 0$;*
- 9** *$r(sv) = (rs)v$.*

Centered dataset

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Definition 1.5 (Centered Versus Non-Centered)

If x_1, x_2, \dots, x_N is a dataset of points with mean m and

$$v_1 = x_1 - m, v_2 = x_2 - m, \dots, v_N = x_N - m,$$

then v_1, v_2, \dots, v_N is a centered dataset of vectors where its mean is zero.

Some notes

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

- When we work with vector spaces, numbers are referred to as *scalars*.
- When we multiply a vector v by a scalar r to get the scaled vector rv , we call it *scalar multiplication*.
- The set of all real numbers \mathbb{R} is a vector space.
- The set of all integers \mathbb{Z} is not a vector space.
- The set of all rational numbers \mathbb{Q} is a vector space.
- The set of all Python strings is not a vector space.
- Usually, we can't take sample means from a population, we instead take the sample mean of a *statistic* associated to the population. A statistic is an assignment of a number $f(\text{item})$ to each item in the population. For example, the human population on Earth is not a vector space (they can't be added), but their heights is a vector space (heights can be added). For the Python strings, a statistic might be the length of the strings. For the HTML colors, a statistic is the HTML code of the color.

In general, a statistic need not be a number. A statistic can be anything that "behaves like a number". For example, $f(\text{item})$ can be a vector or a matrix. More generally, a statistic's values may be anything that lives in a vector space V .

Cartesian plane

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

The *cartesian plane* \mathbb{R}^2 , also called 2-dimensional real space is a vector space.

For $\mathbf{v}_1 = (x_1, y_1)$, $\mathbf{v}_2 = (x_2, y_2) \in \mathbb{R}^2$ and $t \in \mathbb{R}$ define

- $\mathbf{v}_1 + \mathbf{v}_2 = (x_1 + x_2, y_1 + y_2)$ (Addition).
- $\mathbf{0} = (0, 0)$ (Zero).
- $t\mathbf{v}_1 = (tx_1, ty_1)$ (Scaling).
- $-\mathbf{v}_1 = (-1)\mathbf{v}_1$ (Negative).
- $\mathbf{v}_1 - \mathbf{v}_2 = \mathbf{v}_1 + (-\mathbf{v}_2) = (x_1 - x_2, y_1 - y_2)$ (Subtraction).

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

For the two-dimensional dataset

$$\mathbf{x}_1 = (1, 2), \mathbf{x}_2 = (3, 4), \mathbf{x}_3 = (-2, 11), \mathbf{x}_4 = (0, 66),$$

or, equivalently,

$$\mathbf{x} = \begin{pmatrix} 1 & 2 \\ 3 & 4 \\ -2 & 11 \\ 0 & 66 \end{pmatrix},$$

the average is

$$\frac{(1, 2) + (3, 4) + (-2, 11) + (0, 66)}{4} = (0.5, 20.75).$$

Example 1.7

```
1 import numpy as np
2
3 dataset = np.array([[1,2], [3,4], [-2,11], [0,66]])
4 print(np.mean(dataset, axis=0))
5 # returns [ 0.5 , 20.75]
```

```
1 import numpy as np
2 from numpy.random import random as rd
3 import matplotlib.pyplot as plt
4 N = 20
5 dataset = np.array([[rd(), rd()] for _ in range(N)])
6 mean = np.mean(dataset,axis=0)
7 plt.grid()
8 X, Y = dataset[:,0], dataset[:,1]
9 plt.scatter(X,Y)
10 plt.scatter(*mean)
11 plt.annotate('$m$', xy=mean+0.01)
12 plt.show()
```

Magnitude

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Definition 1.6 (Distance Formula)

If $\mathbf{v}_1 = (x_1, y_1)$ and $\mathbf{v}_2 = (x_2, y_2)$, then the distance between \mathbf{v}_1 and \mathbf{v}_2 is

$$|\mathbf{v}_1 - \mathbf{v}_2| = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}.$$

The distance of $\mathbf{v} = (x, y)$ to the origin $\mathbf{0} = (0, 0)$ is its magnitude or norm or length

$$r = |\mathbf{v}| = |\mathbf{v} - \mathbf{0}| = \sqrt{x^2 + y^2}.$$

Example 1.9

For $\mathbf{v}_1 = (1, 2)$ and $\mathbf{v}_2 = (3, 4)$

$$|\mathbf{v}_1| = \sqrt{1^2 + 2^2} = \sqrt{5} \simeq 2.236,$$

$$|\mathbf{v}_1 - \mathbf{v}_2| = \sqrt{(1 - 3)^2 + (2 - 4)^2} = \sqrt{4 + 4} = \sqrt{8} \simeq 2.828.$$

```

1  import numpy as np
2
3  v1 = np.array([1,2])
4  v2 = np.array([3,4])
5  print(np.linalg.norm(v1)) #returns 2.23606797749979
6  print(np.linalg.norm(v1-v2)) #returns 2.

```

Polar representation

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

In terms of r and θ , the *polar representation* of (x, y) is

$$x = r \cos \theta, \quad y = r \sin \theta.$$

The *unit circle* consists of the vectors which are distance 1 from the origin $\mathbf{0}$. When \mathbf{v} is on the unit circle, the magnitude of \mathbf{v} is 1, and we say \mathbf{v} is a *unit vector*. In this case, the line formed by the scalings of \mathbf{v} intersects the unit circle at $\pm \mathbf{v}$.

When \mathbf{v} is a unit vector, then $r = 1$ and $\mathbf{v} = (x, y) = (\cos \theta, \sin \theta)$.

Polar representation

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

By the distance formula, a vector $\mathbf{v} = (x, y)$ is a unit vector when

$$x^2 + y^2 = 1.$$

More generally, any circle with *center* (a, b) and radius r consists of vectors $\mathbf{v} = (x, y)$ satisfying

$$(x - a)^2 + (y - b)^2 = r^2.$$

Let R be a point on the unit circle, and let $t > 0$. The scaled point tR is on the circle with center $(0, 0)$ and radius t . Moreover, if Q is any point, $Q + tR$ is on the circle with center Q and radius t . It is easy to check that $|t\mathbf{v}| = |t||\mathbf{v}|$ for any real number t and vector \mathbf{v} .

From this, if a vector \mathbf{v} is unit and $r > 0$, then $r\mathbf{v}$ has magnitude r . If \mathbf{v} is any vector not equal to the zero vector, then $r = |\mathbf{v}|$ is positive, and

$$\left| \frac{1}{r} \mathbf{v} \right| = \frac{1}{r} |\mathbf{v}| = \frac{1}{r} r = 1$$

so \mathbf{v}/r is a unit vector.

Inner product

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Definition 1.7

Let $\mathbf{v}_1 = (x_1, y_1)$, $\mathbf{v}_2 = (x_2, y_2) \in \mathbb{R}^2$. The inner product or the dot product of \mathbf{v}_1 and \mathbf{v}_2 is given algebraically as

$$\mathbf{v}_1 \cdot \mathbf{v}_2 = x_1x_2 + y_1y_2.$$

From the geometric view, we have:

Theorem 1.1 (Dot Product Identity)

$$x_1x_2 + y_1y_2 = \mathbf{v}_1 \cdot \mathbf{v}_2 = |\mathbf{v}_1||\mathbf{v}_2| \cos \theta,$$

where θ is the angle between \mathbf{v}_1 and \mathbf{v}_2 .

Exercise 1.3

Prove the "Dot Product Identity", Theorem (1.1).

Hint: Use Pythagoras' theorem for general triangles.

The angle between two vectors

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

In Python, the dot product is given by `numpy.dot` and as a consequence of the dot product identity, we have the code for the angle between two vectors:

$$\theta_{\mathbf{v}_1, \mathbf{v}_2} = \arccos \left(\frac{\mathbf{v}_1 \cdot \mathbf{v}_2}{|\mathbf{v}_1| |\mathbf{v}_2|} \right).$$

Example 1.10

Find the angle between the vectors $\mathbf{v}_1 = (1, 2)$ and $\mathbf{v}_2 = (3, 4)$.

```
1  import numpy as np
2
3  def angle(u,v):
4      a = np.dot(u,v)
5      b = np.dot(u,u)
6      c = np.dot(v,v)
7      theta = np.arccos(a / np.sqrt(b*c))
8      return np.degrees(theta)
9
10 v1 = np.array([1,2])
11 v2 = np.array([3,4])
12 print(angle(v1,v2)) #returns 10.304846468766044 in
                        degree
```

Cauchy-Schwarz Inequality

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Recall that $-1 \leq \cos \theta \leq 1$. Using the dot product identity, we obtain the important inequality:

Theorem 1.2 (Cauchy-Schwarz Inequality)

If u and v are any two vectors, then

$$-|u||v| \leq u \cdot v \leq |u||v|.$$

Exercise 1.4

Prove the "Cauchy-Schwarz Inequality".

2d linear equations system

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Consider the homogeneous system

$$\begin{cases} ax + by = 0 \\ cx + dy = 0 \end{cases} \quad (1.1)$$

and let A be the 2×2 matrix

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}. \quad (1.2)$$

$(x, y) = (-b, a)$ is a solution of the first equation in (1.1). If we want this to be a solution of the second equation as well, we must have $cx + dy = ad - bc = 0$.

Definition 1.8 (Determinant)

The determinant of A is

$$\det(A) = \det \begin{pmatrix} a & b \\ c & d \end{pmatrix} = ad - bc.$$

2d linear equations system

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Theorem 1.3 (Homogeneous System)

*When $\det(A) = 0$, the homogeneous system (1.1) has a nonzero solution, and all solutions are scalar multiples of $(x, y) = (-b, a)$.
When $\det(A) \neq 0$, the only solution is $(x, y) = (0, 0)$.*

For the inhomogeneous case

$$\begin{cases} ax + by = e \\ cx + dy = f \end{cases} \quad (1.3)$$

we have

Theorem 1.4 (Inhomogeneous System)

When $\det(A) \neq 0$, the inhomogeneous system (1.3) has the unique solution

$$\begin{pmatrix} x \\ y \end{pmatrix} = \frac{1}{\det(A)} \begin{pmatrix} de - bf \\ af - ce \end{pmatrix}.$$

When $\det(A) = 0$, (1.3) has a solution iff $ce = af$ and $de = bf$.

2d linear equations system

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

When $a^2 + b^2 \neq 0$, a solution is

$$\begin{pmatrix} x \\ y \end{pmatrix} = \frac{1}{a^2 + b^2} \begin{pmatrix} ae \\ be \end{pmatrix}.$$

When $c^2 + d^2 \neq 0$, a solution is

$$\begin{pmatrix} x \\ y \end{pmatrix} = \frac{1}{c^2 + d^2} \begin{pmatrix} cf \\ df \end{pmatrix}.$$

Any other solution differs from these solutions by a scalar multiple of the homogeneous solution $(x, y) = (-b, a)$.

Exercise 1.5

Prove the Theorems (1.3) and (1.4).

Complex numbers

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Roughly speaking, the set of all *complex numbers* is the set of all points in \mathbb{R}^2 with different multiplication rule.

Definition 1.9 (Complex numbers)

The complex numbers, \mathbb{C} , is the set

$$\mathbb{C} = \{(x, y) \in \mathbb{R}^2\}$$

with operations

- *Addition:* $(x_1, y_1) + (x_2, y_2) = (x_1 + x_2, y_1 + y_2)$.
- *Scalar Multiplication:* $t(x, y) = (tx, ty)$
- *Multiplication:* $(x_1, y_1)(x_2, y_2) = (x_1x_2 - y_1y_2, x_1y_2 + x_2y_1)$.

Then, in \mathbb{C} , we have

- zero: $0 = (0, 0)$.
- opposite or additive inverse: $-(x, y) = (-x, -y)$.
- one: $1 = (1, 0)$.

Example

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Example 1.11

- $(1, 2) + (3, 4) = (4, 6).$
- $(0, 0) + (1, 2) = (1, 2).$
- $3(1, 2) = (3, 6).$
- $(1, 0)(1, 2) = (1 - 0, 2 + 0) = (1, 2).$
- $(1, 2)(3, 4) = (3 - 8, 4 + 6) = (-5, 10).$
- $(x, 0) + (y, 0) = (x + y, 0).$
- $(x, 0)(y, 0) = (xy, 0).$

Note. By the last two examples, we see that complex numbers with 0 as their second component act like real numbers in addition and multiplication. So, from now on, we set $x = (x, 0).$

Example 1.12

- $0 = (0, 0).$
- $1 = (1, 0).$
- $-1 = (-1, 0).$

Imaginary number

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Definition 1.10 (Imaginary number)

$$i = (0, 1).$$

Note. Python uses the symbol j for imaginary number.

Theorem 1.5

For each $z = (x, y) \in \mathbb{C}$, we can write

$$z = x + iy.$$

We call x as the real part of z , and y the imaginary part of z .

$$x = \text{Re}(z), \quad y = \text{Im}(z).$$

Proof. $x + iy = (x, 0) + (0, 1)(y, 0) = (x, 0) + (0 - 0, 0 + y) = (x, y).$

Theorem 1.6

$$i^2 = -1.$$

Proof. $i^2 = (0, 1)(0, 1) = (0 - 1, 0 + 0) = (-1, 0) = -1.$

Example

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Example 1.13

In complex numbers:

- $\sqrt{-1} = i.$
- $\sqrt{-4} = 2i.$
- $(1, 2)(3, 4) = (1 + 2i)(3 + 4i)$
$$= 3 + 4i + 6i + 8i^2$$
$$= 3 + 10i - 8$$
$$= -5 + 10i$$
$$= (-5, 10).$$
- $(1, 2)^3 = (1 + 2i)^3$
$$= (1)^3 + 3(1)^2(2i) + 3(1)(2i)^2 + (2i)^3$$
$$= 1 + 6i + 12i^2 + 8i^3$$
$$= 1 + 6i - 12 - 8i$$
$$= -11 - 2i$$
$$= -(11, 2).$$

Conjugate

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Definition 1.11 (Conjugate)

For $z = (x, y) \in \mathbb{C}$, the conjugate is

$$\bar{z} = (x, -y) = x - iy \in \mathbb{C}.$$

Some properties.

- $z + \bar{z} = 2\operatorname{Re}(z)$, $z - \bar{z} = 2i\operatorname{Im}(z)$.

- $z\bar{z} = \operatorname{Re}(z)^2 + \operatorname{Im}(z)^2$,

$$\Rightarrow |z| = \sqrt{\operatorname{Re}(z)^2 + \operatorname{Im}(z)^2} = \sqrt{z\bar{z}}$$

$$\Rightarrow |z|^2 = z\bar{z}.$$

Example 1.14

For $z = (4, -3) \in \mathbb{C}$:

- $\bar{z} = (4, 3) = 4 + 3i$,

- $z + \bar{z} = 2 \times 4 = 8$, $z - \bar{z} = 2i \times (-3) = -6i$.

- $z\bar{z} = (4)^2 + (-3)^2 = 16 + 9 = 25 \Rightarrow |z| = \sqrt{25} = 5$.

- $z^2 = (4 - 3i)^2 = 7 - 24i$.

- $|z|^2 = 25$.

Theorem 1.7

For a non-zero $z \in \mathbb{C}$, the inverse of z is

$$z^{-1} = \frac{1}{z} = \frac{\bar{z}}{z\bar{z}} = \frac{\bar{z}}{|z|^2}.$$

Proof. Firstly, if $z = (x, y)$ then $\frac{1}{z} \in \mathbb{C}$, because,

$$\frac{1}{z} = \frac{x - iy}{x^2 + y^2} = \left(\frac{x}{x^2 + y^2}, \frac{-y}{x^2 + y^2} \right) \in \mathbb{C}.$$

Secondly,

$$zz^{-1} = (x + iy) \left(\frac{x - iy}{x^2 + y^2} \right) = \frac{x^2 + y^2}{x^2 + y^2} = 1.$$

Corollary 1.1 (Division)

For $z_1 \in \mathbb{C}$ and $0 \neq z_2 \in \mathbb{C}$

$$\frac{z_1}{z_2} = z_1 z_2^{-1}.$$

Mean and Covariance

Definition 1.12 (Mean-squared distance)

Let x_1, x_2, \dots, x_N be a dataset, say D , in \mathbb{R}^d , and let $x \in \mathbb{R}^d$. The mean-square distance of x to D is

$$MSD(x) = \frac{1}{N} \sum_{k=1}^N |x_k - x|^2.$$

Definition 1.13 (Mean)

Let x_1, x_2, \dots, x_N be a dataset in \mathbb{R}^d . The mean or sample mean is

$$m = \bar{x}_N = \frac{1}{N} \sum_{k=1}^N x_k = \frac{x_1 + x_2 + \dots + x_N}{N}.$$

Theorem 1.8 (Point of Best-fit)

The mean is the point of best-fit: The mean minimizes the mean-squared distance to the dataset.

Exercise 1.6

Prove the Theorem (1.8).

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

For simplicity, let $u = (a, b)$ and $v = (c, d, e)$ be two vectors.

Definition 1.14 (Tensor product)

The tensor product of u and v is the matrix

$$u \otimes v = \begin{pmatrix} ac & ad & ae \\ bc & bd & be \end{pmatrix} = \begin{pmatrix} cu & du & eu \end{pmatrix} = \begin{pmatrix} av \\ bv \end{pmatrix}$$

Definition 1.15 (Trace of a matrix)

The trace of a squared matrix A is the sum of the diagonal entries.

Note. For any vectors u, v and w :

- $v \otimes u = (u \otimes v)^t.$

In square case:

- $\det(u \otimes v) = 0.$
- $\text{trace}(u \otimes v) = u \cdot v.$
- $\text{trace}(u \otimes u) = |u|^2.$
- $(u \otimes v)w = (v \cdot w)u.$

Covariance

Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Let x_1, x_2, \dots, x_N be a dataset in \mathbb{R}^d with m as its mean.

Definition 1.16 (1d Covariance)

When $d = 1$, the covariance q is a scalar

$$q = \frac{1}{N} \sum_{k=1}^N (x_k - m)^2 = MSD(m).$$

In the scalar case, the covariance is called the variance of the scalar dataset.

In general, the covariance is a symmetric $d \times d$ matrix Q . We can center the dataset as

$$v_1 = x_1 - m, v_2 = x_2 - m, \dots, v_N = x_N - m.$$

Then the *covariance matrix* is the $d \times d$ matrix Q as

$$Q = \frac{v_1 \otimes v_1 + v_2 \otimes v_2 + \dots + v_N \otimes v_N}{N}. \quad (1.4)$$

Example

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Example 1.16

Suppose $N = 5$ and

$$x_1 = (1, 2), \quad x_2 = (3, 4), \quad x_3 = (5, 6), \quad x_4 = (7, 8), \quad x_5 = (9, 10).$$

Then $m = (5, 6)$ and

$$v_1 = x_1 - m = (-4, -4), \quad v_2 = x_2 - m = (-2, -2),$$

$$v_3 = x_3 - m = (0, 0), \quad v_4 = x_4 - m = (2, 2), \quad v_5 = x_5 - m = (4, 4).$$

Since

$$(\pm 4, \pm 4) \otimes (\pm 4, \pm 4) = \begin{pmatrix} 16 & 16 \\ 16 & 16 \end{pmatrix},$$

$$(\pm 2, \pm 2) \otimes (\pm 2, \pm 2) = \begin{pmatrix} 4 & 4 \\ 4 & 4 \end{pmatrix},$$

$$(0, 0) \otimes (0, 0) = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix},$$

then

$$Q = \begin{pmatrix} 8 & 8 \\ 8 & 8 \end{pmatrix}.$$

Example

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Example 1.17

```
1  import numpy as np
2
3  def tensor(u,v):
4      return np.array([ [ a*b for b in v] for a in u ])
5
6  np.random.seed(1)
7  N = 20
8  dataset = np.array([ [np.random.random(),np.random.
                        random()] for _ in range(N)
                        ])
9
10 # mean
11 m = np.mean(dataset,axis=0)
12 # center dataset
13 vectors = dataset - m
14 # covariance
15 Q = np.mean([ tensor(v,v) for v in vectors ],axis=0)
16 print(Q)
```

Note. The covariance matrix as written in (1.4) is the *biased covariance matrix*. If the denominator is instead $N - 1$, the matrix is the *unbiased covariance matrix*.

For datasets with large N , it doesn't matter, since N and $N - 1$ are almost equal.

In numpy, the Python covariance constructor is

Example 1.18

```
1  import numpy as np
2
3  np.random.seed(1)
4  N = 20
5  dataset = np.array([ [np.random.random(), np.random.
                        random()] for _ in range(N)
                        ])
6
7  # covariance
8  Q = np.cov(dataset, bias=True, rowvar=False)
9  print(Q)
```

Total variance

Math for Data

Dr. S. M.
Moosavi

Data Sets

Introduction

Averages and Vector
Spaces

Two Dimensions

Complex Numbers

Mean and Covariance

Definition 1.17 (Total variance)

From $\text{trace}(u \otimes u) = |u|^2$, if Q is the covariance matrix then

$$\text{trace}(Q) = \frac{1}{N} \sum_{k=1}^N |x_k - m|^2. \quad (1.5)$$

We call (1.5) the total variance of the dataset. Thus the total variance equals $\text{MSD}(m)$.

Example 1.19

```
1  import numpy as np
2
3  np.random.seed(1)
4  N = 20
5  dataset = np.array([ [np.random.random(), np.random.
                        random()] for _ in range(N) ])
6
7  # covariance
8  Q = np.cov(dataset.T, bias=True)
9  print(Q.trace()) # returns 0.16047818727212101
```
